Drivers

Nvidia drivers version 456.38 and above

AJA Version 15.5.1.2

Operating System Requirements

Windows 10.

NOTE that Windows 11 is not yet qualified in this release

MacOS Catalina and above.

General

Note: release notes will now only show changes from 5.4.3_r29447 version.

Please see previous versions of 5.4.3 for earlier changes.

Tactic

- Fix the Malware alert that could occur when running the application, due to revoked certificates.
- Paused movies when re-started without reset ended up with stuttering audio after 3-4 re-starts.

Data Server/Swift Live

- Handle more file types in the file browser.

- Handle clearing and saving pages across multiple sections.
- The handling of the addition of clicks and stages in the graphic editor did not produce consistent stacks. This happens mostly when a graphic is updated on a stage. Now when a stage is added no graphic (null) is set on it. When a graphic is set on a stage all other stages with the graphic already in the stage are set to the new graphic. The click name is used as a hint for the stage method.
- Add scripts to sync the sessions (as well as robocopy them).
- Set the graphic type and path when load the graphic manifest.
- Added a method to create a link on the server (using the text/link mime type of an ajax POST call).
- Use the CreateLink method to create a link to the MediaStore images folder in a session folder.
- Put in a check when creating a link from a http request that the source file exists.
- A mistaken commit removed the code that made DataClient a service.
- Added a option to create a link (junction) using a text/link mime.
